## MODEL 601 BLANCHER

Equipped with a 230/460 Volt, 60Hz., 3 Phase, 5HP electric motor which drives a hydraulic pump, which in turn drives the cylinder through a hydraulic motor.

The cylinder is supported on the inlet end by two (2) 8" diameter travelers. It is supported on the discharge end by a large shaft through a single bearing from which it is driven.

The cylinder is constructed of 18 gauge perforated stainless steel. There are two (2) removable panels the full length of the cylinder, 180° apart, for easy access to the inside for cleaning. There are perforated lifters to discharge the product above the water level. Both the inlet and discharge chute are unobstructed so that product can flow in or out freely.

The tank is constructed of 12 gauge.

The top cover is a one piece unit which can be raised for cleaning. The raising mechanism is a set of four screw actuators, one on each corner of the cover, that are raised simultaneously with a single hydraulic motor, driven from the power pak.
